

Unit 2 CodeBot Python Code By Mission

Mission 4 Lesson 1 – Animatronics (Objectives 1-3)	
<code>while True:</code>	Infinite loop
<code>leds.user_num(n_led, True)</code>	Use a variable for the LED number
<code>n_led = n_led + 1</code>	. Updating a variable; incrementing
<p>Use the debugger to view variables.</p> <p>Open the console panel and click on the “debug” window while debugging.</p>	
<pre>if n_led == 8: n_led = 0</pre>	Check if a variable is the same as a specific value. If so, reset the variable to its initial value.
Mission 4 Lesson 2 – Animatronics (Objectives 4-7)	
<code>break</code>	Break out of a loop
<code>leds.ls_num(n_guests, True)</code>	Turn on a line sensor LED, using a variable to indicate which LED
<code>n_guests = n_guests + 1</code>	Increment
<code>spkr.pitch(440)</code>	Play a tone on the speaker. The argument is the pitch frequency in Hertz.
<code>spkr.off()</code>	Turn off the speaker
<code>buttons.was_pressed(0)</code>	Debounce a button press by resetting the internal status
Mission 4 Lesson 3 – Animatronics (Objectives 8-11)	
<code>while f < 1000:</code>	<p>Basic structure of a while loop.</p> <p>In this example, the loop will continue to execute until f is equal to or greater than 1000.</p>
<pre>count = 0 while count < 10: count = count + 1</pre>	<p>A while loop starts a block of code, so all commands that are to be repeated must be indented below the while loop.</p> <p>** The control variable (count) must be initialized before the loop starts.</p> <p>** The control variable (count) must be incremented inside the loop! Otherwise it is an infinite loop.</p>

<code>from random import randrange</code>	Import the randrange() function from the random module (library)
<code>f = randrange(100, 1000)</code>	Generate a random integer within a range (possible numbers include first value up to one less than second value)
<pre>def flashLEDs(): {indented block of code} def note(freq, duration): spkr.pitch(freq) sleep(duration) spkr.off() sleep(0.05)</pre>	Define a function. A function definition always has (), even if there are no parameters.
<pre>flashLEDs() note(349, 0.4)</pre>	Function call. A function call uses the name and (), but not the “def”. If the function has parameters, the function call includes arguments, or values, that get passed to the parameters.
Mission 4 Lesson 4 – Animatronics (Objective 12)	
<pre>F4 = 349 C5 = 523</pre>	Define a constant (usually with ALL CAPS)
<pre>note(F4, 0.1) note(C5, 0.8)</pre>	Use a constant as an argument in a function call
